Important

Before attempting any external or internal work on the cylinder or any connected components, make sure the cylinder is vented and disconnect the air supply in order to ensure isolation of the air supply.

Note

All technical data in this catalogue are typical data only.
Air quality is essential for maximum cylinder service life (see ISO 8573).

WARNING

FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS AND/OR SYSTEMS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

This document and other information from Parker Hannifin Corporation, its subsidiaries and authorized distributors provide product and/or system options for further investigation by users having technical expertise. It is important that you analyze all aspects of your application and review the information concerning the product or system in the current product catalog. Due to the variety of operating conditions and applications for these products or systems, the user, through its own analysis and testing, is solely responsible for making the final selection of the products and systems and assuring that all performance, safety and warning requirements of the application are met. The products described herein, including without limitation, product features, specifications, designs, availability and pricing, are subject to change by Parker Hannifin Corporation and its subsidiaries at any time without notice.

SALE CONDITIONS

The items described in this document are available for sale by Parker Hannifin Corporation, its subsidiaries or its authorized distributors. Any sale contract entered into by Parker will be governed by the provisions stated in Parker's standard terms and conditions of sale (copy available upon request).

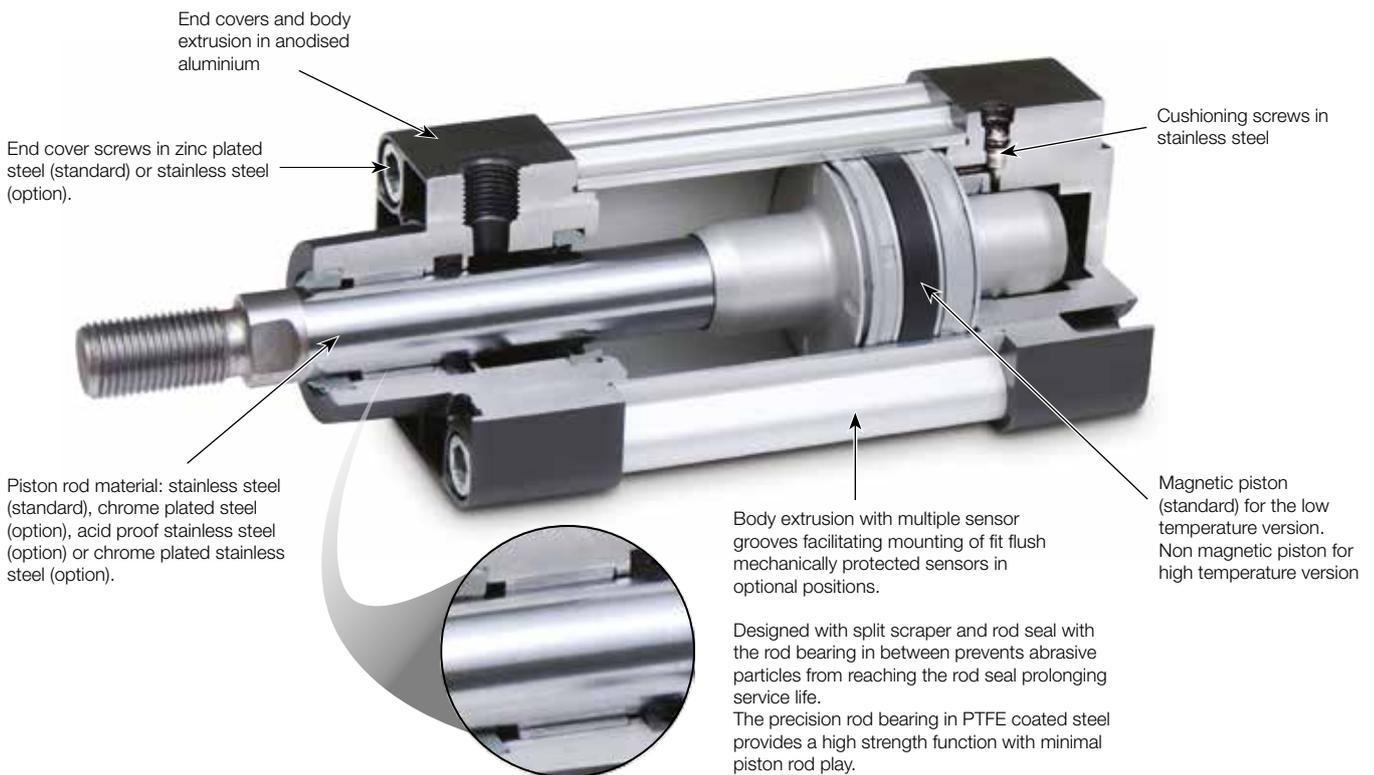

Extreme Environments

Use P1D-X Pneumatic ISO Cylinders

Challenges encountered within rigorous environments require leading engineered solutions and products. Meeting these exacting needs the P1D-X Series of ISO 15552 pneumatic cylinders provides the answer for high and low temperature applications. Engineered to provide superior performance in harsh conditions using proven class leading seal technology for reliable operation and

long service life in temperatures down to -40°C and up to $+150^{\circ}\text{C}$. With robust corrosion resistant metal body, PTFE coated steel bearing and optional metal scraper the P1D-X Series is available in bore sizes 32 to 125mm. Fully supported by a range of ISO mountings the P1D-X leads the way in today's changing climate.

Proven pneumatic cylinders up to 150°C

The new high temperature P1D-X range has been developed based on the know-how over decades from a variety of high temperature applications for pneumatic actuators e.g. for use in boilers and iron works.

More specifically the vast and in-depth experience from 40 years as leading partner for dedicated Crust Breaker cylinders to the Aluminium Smelter Industry (production of primary aluminium) has been a decisive knowledge and reference for the design work. The results from extensive testing and the long reference list of proven, successful Aluminium Smelter applications with Crust Breaker and Feeder cylinder operating continuously, year after year, in up to 150°C has given us a solid knowledge for the design of P1D-X.

Aluminium Smelter Industry

Crust Breaker Cylinders operate continuously in up to 150°C to break the crust in each pot to facilitate refilling of raw material (alumina).

Heavy Industry

- High temperature operation
- Robust and reliable
- Long service life

Seal and grease technology for high temperatures

The key for reliable operation of pneumatic cylinders in high temperatures is the seal and grease system. It takes thorough testing to arrive at the optimum and proven technology.

- Seals in proven FPM (Viton) material for reliability and long service life.
- Dedicated high temperature grease with special formula is vital for the performance of the cylinder.
- The combined system of seals and grease developed for P1D-X is the key for the excellent function in the temperature range -10°C to +150°C.

High temperature cylinder series

P1D-X ***MF

- ISO 15552 conformity
- Bore sizes Ø32 - Ø125 mm
- Temperature range -10°C to +150°C
- Corrosion resistant

Reliable low temperature pneumatic cylinders

As a developer of engineered solutions Parker Hannifin is a major supplier to companies within the Bus, Truck and Rail industries. The experience gained over the decades on these demanding applications has formed the basis for the development of our new generation of low temperature pneumatic cylinders. Repeated high reliability in extreme temperature conditions, sealing systems with low leakage and corrosion resistance design are key product properties engineered into the P1D-X Series of low temperature cylinders.

Seal technology

Parker have combined the most sought after features of seal technology to provide low temperature pneumatic cylinders with high reliability, low leakage and long service life.

- Seals engineered for low temperature in polyurethane formulated specifically for optimal performance in the temperature range -40°C to +80°C.
- Seal material retains its elastic properties with maintained performance even at extreme low temperatures.
- Low temperature characteristics but maintaining superior wear resistance.
- Industrial proven profiles.

Features

- Lightweight diecast aluminium construction but maintaining torsional rigidity
- End covers and body extrusion in anodised aluminium as well as piston rod and cushioning screws in stainless steel.
- Grease specifically formulated to support performance and reliability at low temperatures
- Proximity sensing (but please note that the sensors are normally specified for full performance down to -25°C only)
- A wide range of cylinder mountings in anodised aluminium providing the same overall corrosion resistance.

Low temperature cylinder series

P1D-X ***ML

- Temperature range -40°C to +80°C
- ISO 15552 conformity
- Bore sizes Ø32 - Ø125 mm
- Corrosion resistant

Bus Industry

- Operational reliability
- Flexible mounting
- Easily accessible adjustment
- Repairable

Road Industry

- Long life non lube service
- Leak proof design
- Corrosion resistant surface
- Easily repairable

Rail Industry

- User servicable construction
- Performance and reliability
- Low friction seal technology

P1D-X High Temperature Cylinders

All seals in the high temperature version of P1D-X are developed and validated for continuous operation up to +150° C. The combination of the seal geometry and the FPM material (Viton) ensures reliable and long service life. Certain restrictions apply when choosing sensors due to the temperature range. High temperature cylinders have no magnetic piston and cannot be fitted with sensors (the magnetic field strength in high temperatures is too low to ensure correct reliable sensor function).

- Conforms to ISO 15552.
- Bore 32-125 mm.
- Double acting.
- Stainless steel piston rod.
- Adjustable air cushioning.
- Wide range of mountings.

The cylinders are supplied complete with a zinc plated steel piston rod nut.

P1D-X Low Temperature Cylinders

All seals in the low temperature version of P1D-X are developed and validated for continuous operation down to -40°C . Polyurethane PUR seal technology and specifically formulated grease support performance and reliability for low temperature applications. As standard supplied with a magnetic ring in the piston for proximity sensing but please note that the sensors are normally specified for full performance to -25°C only.

- Conforms to ISO 15552.
- Bore 32-125 mm.
- Double acting.
- Stainless steel piston rod.
- Adjustable air cushioning.
- Wide range of mountings and drop-in sensors.

P1D-X Low Pressure Hydraulic Cylinders

All seals in the low hydraulic version of P1D-X are developed and validated for continuous operation down to -20°C . Mineral oil is used instead of compressed air at pressure lower than 10 bar.

- Conforms to ISO 15552.
- Bore 32-125 mm.
- Double acting.
- Chromed plated steel piston rod.
- Wide range of mountings.

Operating information

³⁾ -30°C for low temperature version, not available for high temp.

¹⁾ In combination with metal scraper

²⁾ Piston made in aluminum, not possible for P1D-T Series.

Standard strokes

Standard strokes for all P1D cylinders comply with ISO 4393.
Special strokes up to 2800 mm.

P1D-X Pneumatic ISO Cylinders

1) XXXX = stroke

2) Free air consumption per 10 mm stroke for a double stroke at 6 bar

P1D-X Pneumatic ISO Cylinders

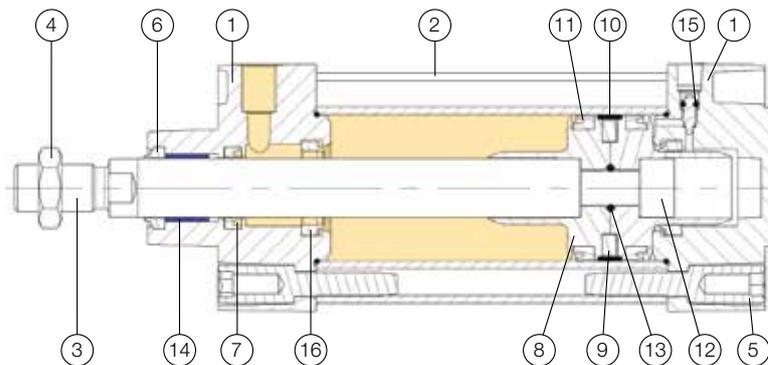

General technical data

Product type	Standard cylinder according to ISO 15552
Bore size	32 - 125 mm
Stroke length	5-2800 mm
Versions	Double acting
Cushioning	Adjustable air cushioning
Position sensing	Proximity sensor in temperature range -25°C to +80°C
Installation	P1D cylinder and piston rod mountings
Mounting position	Any

Operating and environmental data

Operating medium	For best possible service life and trouble-free operation dry, filtered compressed air to ISO 8573-1:2010 quality class 3.4.3 should be used. This specifies a dew point of +3°C for indoor operation (a lower dew point should be selected for minus temperature operation and we recommend the use of an inline dryer) and is in line with the air quality from most standard compressors with a standard filter.		
Operating pressure	0,5 bar to 10 bar	Hydraulic version : 2 bar to 10 bar	
Ambient temperature	High temp version : -10°C to +150°C Low temp version : -40°C to +80°C	Hydraulic version : -20°C to +80°C Metal scraper version : -30°C to +80°C	Standard temp version : -20°C to +80°C
Pre-lubricated	Further lubrication is normally not necessary. If additional lubrication is introduced it must be continued.		
Oil used for hydraulic version	Hydraulic oil type HLP (DIN 51524, ISO 11158). Viscosity by 40°C: 32 mm ² /s (cst). Example: Shell Tellus 32 or equal.		
Corrosion resistance	High resistance to corrosion and chemicals. Materials and surface treatment have been selected for industrial applications where solvents and detergents are frequently used.		

Material specification

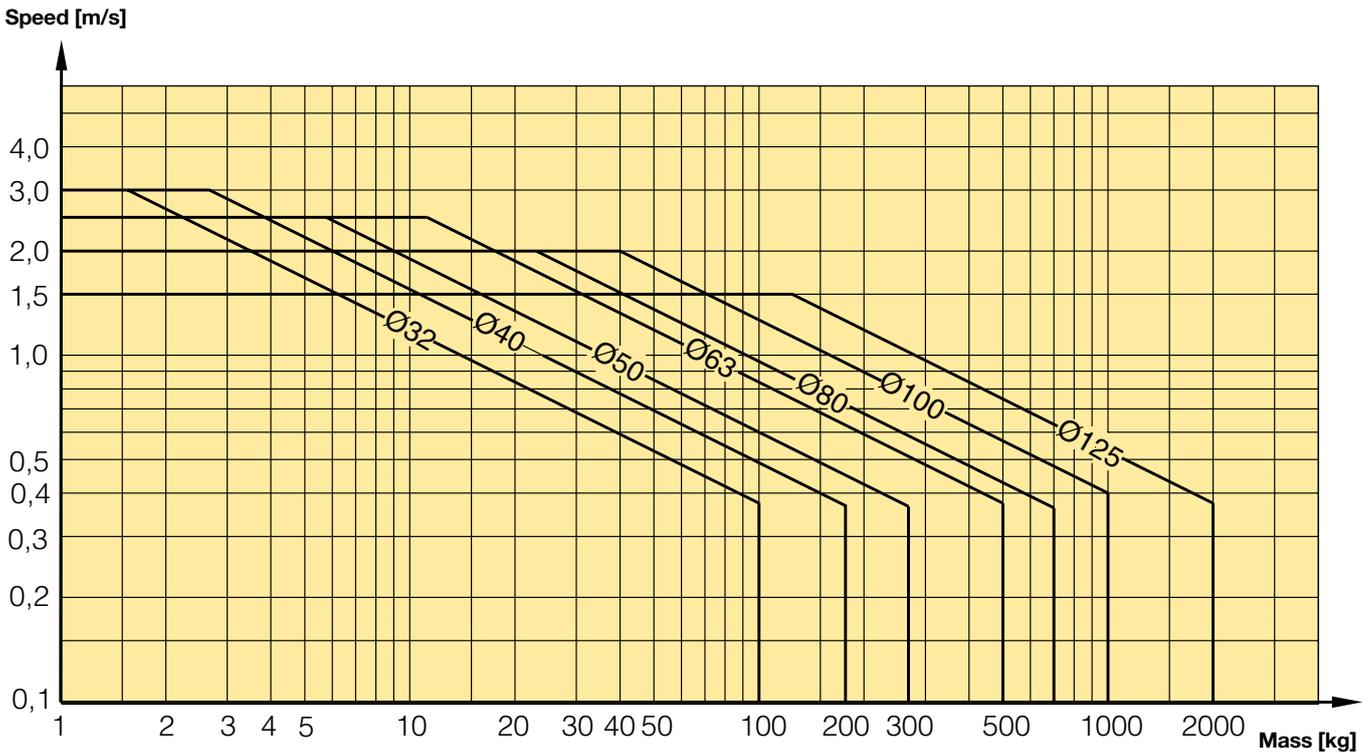

Pos	Part		Specification
1	End covers		Anodised aluminium
2	Cylinder barrel		Anodised aluminium
3	Piston rod	Standard Optional	Stainless steel, DIN X 10 CrNiS 18 9 Hard chromium plated Fe 490-2 FN Acid-proof steel Chrome plated stainless steel
4	Piston rod nut	Standard Optional	Zinc plated steel Stainless steel
5	End cover screws	Standard Optional	Zinc plated steel Stainless steel
6	Scraper ring	High temperature Standard & low temperature, hydraulic	FPM (Viton) PUR (Polyurethane)
7	Piston rod seal	Metal scraper standard temperature	Stainless steel / Brass / NBR
8	Piston	High temperature Standard & low temperature Hydraulic	FPM (Viton) PUR (Polyurethane) NBR(Nitrile)
9	Magnet		Aluminium Plastic coated magnetic material (Low temperature version only)
10	Piston bearing		PTFE
11	Piston seals	High temperature Standard & low temperature Hydraulic	FPM (Viton) PUR (Polyurethane) NBR(Nitrile)
12	Piston bolt		Zinc plated steel
13	O-rings		Nitrile rubber
14	Piston rod bearing		Multilayer PTFE/steel
15	Cushioning screws		Stainless steel, DIN X 10 CrNiS 18 n9
16	Cushioning seals	High temperature Standard & low temperature	FPM (Viton) PUR (Polyurethane)
	Note on materials		RoHS compliant

Cushioning characteristics

The diagram below is used for dimensioning of cylinders related to the cushioning capacity. The maximum cushioning capacity shown in the diagram assumes the following:

- Low load, i.e. low pressure drop across the piston
- Equilibrium speed
- Correctly adjusted cushioning screw
- 6 bar at cylinder port

The load is the sum of internal and external friction, plus any gravitational forces. At high relative load (pressure drop exceeding 1 bar), we recommend that for any given speed, the mass should be reduced by a factor of 2.5, or for a given mass, the speed should be reduced by a factor of 1.5. This is in relation to the maximum performance given in the diagram

P1D-X Pneumatic ISO Cylinders

Guide for selecting suitable tubing

The selection of the correct size of tubing is often based on experience, with no great thought to optimizing energy efficiency and cylinder velocity. This is usually acceptable, but making a rough calculation can result in worthwhile economic gains.

The following is the basic principle:

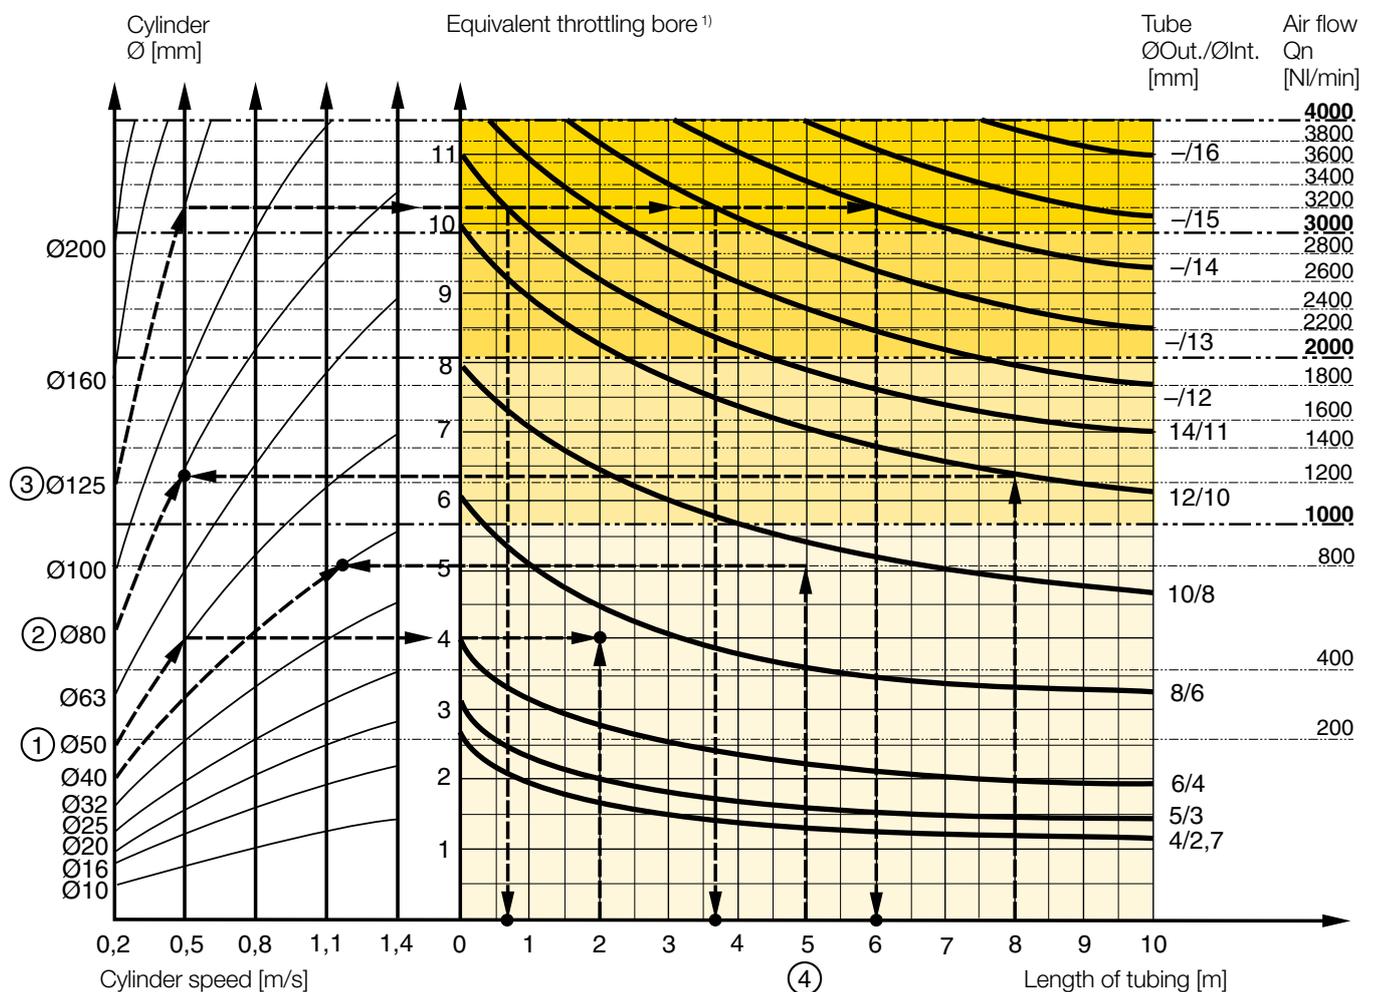

1. The primary line to the working valve could be over sized (this does not cause any extra air consumption and consequently does not create any extra costs in operation).
2. The tubes between the valve and the cylinder should, however, be optimized according to the principle that an insufficient bore throttles the flow and thus limits the cylinder speed, while an oversized pipe creates a dead volume which increases the air consumption and filling time.

The chart below is intended to help when selecting the correct size of tube to use between the valve and the cylinder.

The following prerequisites apply:

The *cylinder load* should be about 50% of the theoretical force (= normal load). A lower load gives a higher velocity and vice versa. The tube size is selected as a function of the *cylinder bore*, the desired *cylinder velocity* and the *tube length* between the valve and the cylinder.

If you want to use the capacity of the valve to its maximum, and obtain maximum speed, the tubing should be chosen so that they at least correspond with the equivalent restriction diameter (see description below), so that the tubing does not restrict the total flow. This means that a short tubing must have at least the equivalent restriction diameter. If the tubing is longer, choose it from the table below. Straight fittings should be chosen for highest flow rates. (Elbow and banjo fittings cause restriction.)

- 1) The "equivalent throttling bore" is a long throttle (for example a tube) or a series of throttles (for example, through a valve) converted to a short throttle which gives a corresponding flow rate. This should not be confused with the "orifice" which is sometimes specified for valves. The value for the orifice does not normally take account of the fact that the valve contains a number of throttles.
- 2) Qn is a measure of the valve flow capacity, with flow measured in litre per minute (l/min) at 6 bar(e) supply pressure and 1 bar pressure drop across the valve.

P1D-X Pneumatic ISO Cylinders

Example ① : Which tube diameter should be used?

A 50 mm bore cylinder is to be operated at 0.5 m/s. The tube length between the valve and cylinder is 2 m. In the diagram we follow the line from 50 mm bore to 0.5 m/s and get an “equivalent throttling bore” of approximately 4 mm. We continue out to the right in the chart and intersect the line for a 2 m tube between the curves for 4 mm (6/4 tube) and 6 mm(8/6 tube). This means that a 6/4 tube throttles the velocity somewhat, while an 8/6 tube is a little too large. We select the 8/6 tube to obtain full cylinder velocity.

Example ② : What cylinder velocity will be obtained?

A 80 mm bore cylinder will be used, connected by 8 m 12/10 tube to a valve with Qn 1200 NI/min. What cylinder velocity will we get? We refer to the diagram and follow the line from 8 mm tube length up to the curve for 12/10 tube. From there, we go horizontally to the curve for the Ø80 cylinder. We find that the velocity will be about 0.5 m/s.

Example ③ : What is the minimum inner diameter and maximum length of tube?

For an application a 125 mm bore cylinder will be used. Maximum velocity of piston rod is 0.5 m/s. The cylinder will be controlled by a valve with Qn 3200 NI/min. What diameter of tube can be used and what is maximum length of tube.

We refer to the diagram. We start at the left side of the diagram cylinder Ø125. We follow the line until the intersection with the velocity line of 0.5 m/s. From here we draw a horizontal line in the diagram. This line shows us we need an equivalent throttling bore of approximately 10 mm. Following this line horizontally we cross a few intersections. These intersections shows us the minimum inner diameter (rightside diagram) in combination with the maximum length of tube (bottomside diagram).

For example:

Intersection one: When a tube (14/11) will be used, the maximum length of tube is 0.7 meter.

Intersection two: When a tube (—/13) will be used, the maximum length of tube is 3.7 meter.

Intersection three: When a tube (—/14) will be used, the maximum length of tube is 6 meter.

Example ④ : Determining tube size and cylinder velocity with a particular cylinder and valve?

For an application using a 40 mm bore cylinder with a valve with Qn=800 NI/min. The distance between the cylinder and valve has been set to 5 m.

Tube dimension: What tube bore should be selected to obtain the maximum cylinder velocity? Start at pipe length 5 m, follow the line up to the intersection with 800 NI/min. Select the next largest tube diameter, in this case Ø10/8 mm.

Cylinder velocity: What maximum cylinder velocity will be obtained? Follow the line for 800 NI/min to the left until it intersects with the line for the Ø40 mm cylinder. In this example, the speed is just above 1.1 m/s.

Flange trunnion ⑪
MT5/MT6

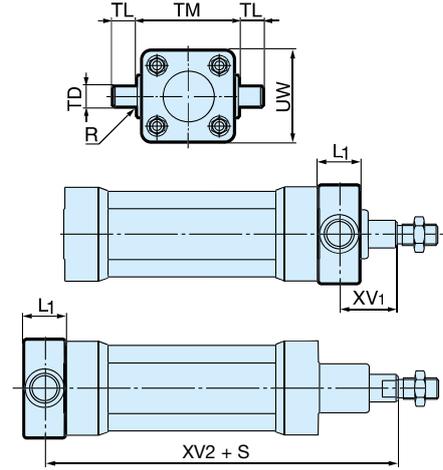

Intended for articulated mounting of cylinder. This trunnion can be flange mounted on the front or rear end covers of all P1D cylinders.

Material:
Trunnion: zinc plated steel
Screws: zinc plated steel, 8.8
Delivered complete with mounting screws for attachment to the cylinder

Cyl. bore mm	TM h14 mm	TL h14 mm	TD e9 mm	R mm	UW mm	L1 mm	XV ₁ mm	XV ₂ mm	Weight Kg	Order code

100	132	25	25	2,0	125	29	37,0	203,5	3,00	P1D-4QMYF

S = Stroke length, does not apply to cylinders with lock unit or with protusion of the piston rod

Intermediate trunnion ⑫
MT4 for P1D-X

Intended for articulated mounting of cylinder. The trunnion is factory-fitted in the centre of the cylinder or at an optional location specified by the XV-measure – see the order code key. Combined with pivot bracket for MT4.

Material: zinc plated steel

Intermediate trunnion
MT4 for P1D-T

Trunnion centred

The centred trunnion for the P1D-S and P1D-T is ordered with letter D in position 17 (no dimension specified in positions 18-20, letters are NNN). See the order code key.

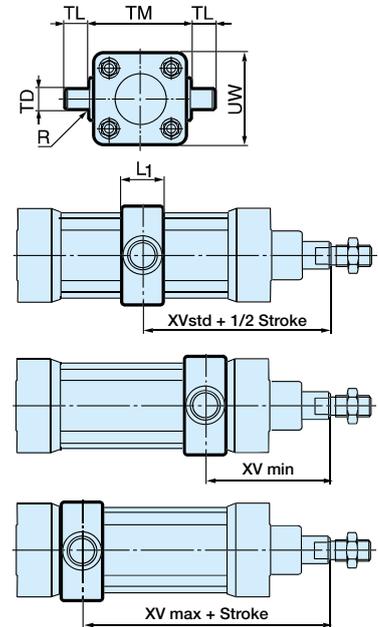

Trunnion with optional postion XV measure

The intermediate trunnion for the P1D-S and P1D-T is ordered with a letter in position 17 and desired XV-measure (3-digits measure in mm) in positions 18-20). See the order code key.

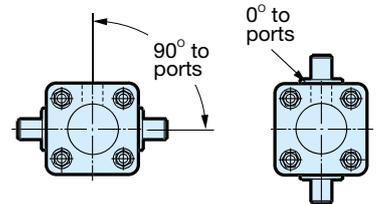

Free trunnion

The centre trunnion for the P1D-S can also be ordered with the intermediate trunnion loosely fitted to the cylinder (not fixed in position). This allows the position to be established at the time of installation.

Ordered with a letter in position 17 and 000 in positions 18-20. Please refer to the order code key.

Important: If the cylinder is ordered with a piston rod protusion (WH dimension), please add this extra length to XVmin, XV and XVmax. Does not apply to cylinders with lock unit or with protusion of the piston rod

Swivel rod eye AP6 ¹³

Swivel rod eye for articulated mounting of cylinder. Swivel rod eye can be combined with clevis bracket GA. Maintenance-free.

Materials
Swivel rod eye: Zinc-plated steel
Swivel bearing according to DIN 648K: Hardened steel

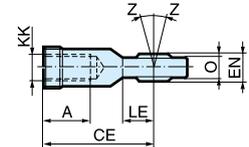

Stainless steel swivel rod eye AP6

Stainless-steel swivel rod eye for articulated mounting of cylinder. Swivel rod eye can be combined with clevis bracket GA. Maintenance-free.

Materials
Swivel rod eye: Stainless steel
Swivel bearing according to DIN 648K: Stainless steel

Use stainless steel nut with stainless steel swivel rod eye.

According to ISO 8139

Nut MR9 * ⁽¹⁶⁾

Intended for fixed mounting of accessories to the piston rod. Material: Zinc-plated steel

All P1D cylinders are delivered with a zinc-plated steel piston rod nut, except P1D Ultra Clean, which is delivered with a stainless steel piston rod nut instead.

Stainless steel nut MR9 * ⁽¹⁶⁾

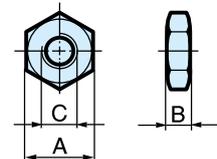

Intended for fixed mounting of accessories to the piston rod.

Material: Stainless steel A2

All P1D cylinders are delivered with a zinc-plated steel piston rod nut, except P1D-C delivered with a stainless steel piston rod nut instead.

According to DIN 439 B

Drop-in sensors

The P1D sensors can easily be installed from the side in the sensor groove, at any position along the piston stroke. The sensors are completely recessed and thus mechanically protected. Choose between electronic or reed sensors and several cable lengths and 8 mm and M12 connectors. The same standard sensors are used for all P1D versions.

Electronic sensors

The electronic sensors are "Solid State", i.e. they have no moving parts at all. They are provided with short-circuit protection and transient protection as standard. The built-in electronics make the sensors suitable for applications with high on and off switching frequency, and where very long service life is required.

Technical data

Design	GMR (Giant Magnetic Resistance) magneto-resistive function
Installation	From side, down into the sensor groove, so-called drop-in
Outputs	PNP, normally open (also available in NPN design, normally closed, on request)
Voltage range	10-30 VDC 10-18 V DC, ATEX sensor
Ripple	max 10%
Voltage drop	max 2,5 V
Load current	max 100 mA
Internal consumption	max 10 mA
Actuating distance	min 9 mm
Hysteresis	max 1,5 mm
Repeatability accuracy	max 0,2 mm
On/off switching frequency	max 5 kHz
On switching time	max 2 ms
Off switching time	max 2 ms
Encapsulation	IP 67 (EN 60529)
Temperature range	-25 °C to +75 °C -20 °C to +45 °C, ATEX sensor
Indication	LED, yellow
Material housing	PA 12
Material screw	Stainless steel
Cable	PVC or PUR 3x0.25 mm ² see order code respectively

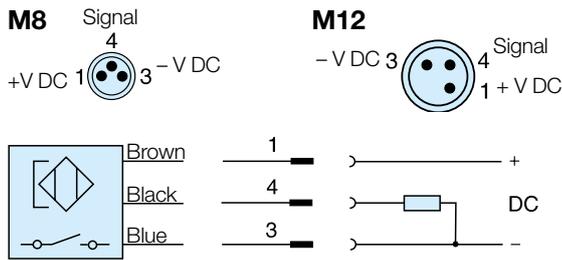

Reed sensors

The sensors are based on proven reed switches, which offer reliable function in many applications. Simple installation, a protected position on the cylinder and clear LED indication are important advantages of this range of sensors.

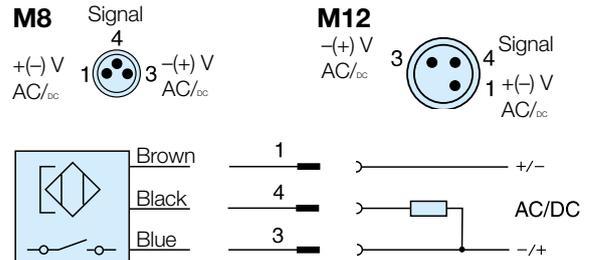

Technical data

Design	Reed element
Mounting	From side, down into the sensor groove, so-called drop-in
Output	Normally open, or normally closed
Voltage range	10-30 V AC/DC or 10-120 V AC/DC 24-230 V AC/DC
Load current	max 500 mA for 10-30 V or max 100 mA for 10-120 V max 30 mA for 24-230 V
Breaking power (resistive)	max 6 W/VA
Actuating distance	min 9 mm
Hysteresis	max 1,5 mm
Repeatability accuracy	0,2 mm
On/off switching frequency	max 400 Hz
On switching time	max 1,5 ms
Off switching time	max 0,5 ms
Encapsulation	IP 67 (EN 60529)
Temperature range	-25 °C to +75 °C
Indication	LED, yellow
Material housing	PA12
Material screw	Stainless steel
Cable	PVC or PUR 3x0.14 mm ² see order code respectively

Any stroke up to max. 2800 mm.

** When ordering piston rods for cylinders with an extended piston rod, add together the stroke and the extension in the order key.
For example, a cylinder with stroke 100 mm and a piston rod extension of 25 mm is ordered with 0125 in the order number.

* 2 piston rod pieces delivered in one set if through rod option selected

P1D with standard profile

P1D with tie rods

Specifying air quality (purity) in accordance with ISO8573-1:2010, the international standard for Compressed Air Quality

ISO8573-1 is the primary document used from the ISO8573 series as it is this document which specifies the amount of contamination allowed in each cubic metre of compressed air.

ISO8573-1 lists the main contaminants as Solid Particulate, Water and Oil. The purity levels for each contaminant are shown separately in tabular form, however for ease of use, this document combines all three contaminants into one easy to use table.

ISO8573-1:2010 CLASS	Solid Particulate			Mass Concentration mg/m ³	Water		Oil
	Maximum number of particles per m ³				Vapour Pressure Dewpoint	Liquid g/m ³	Total Oil (aerosol liquid and vapour) mg/m ³
	0,1 - 0,5 micron	0,5 - 1 micron	1 - 5 micron				
0	As specified by the equipment user or supplier and more stringent than Class 1						
1	≤ 20 000	≤ 400	≤ 10	-	≤ -70 °C	-	0,01
2	≤ 400 000	≤ 6 000	≤ 100	-	≤ -40 °C	-	0,1
3	-	≤ 90 000	≤ 1 000	-	≤ -20 °C	-	1
4	-	-	≤ 10 000	-	≤ +3 °C	-	5
5	-	-	≤ 100 000	-	≤ +7 °C	-	-
6	-	-	-	≤ 5	≤ +10 °C	-	-
7	-	-	-	5 - 10	-	≤ 0,5	-
8	-	-	-	-	-	0,5 - 5	-
9	-	-	-	-	-	5 - 10	-
X	-	-	-	> 10	-	> 10	> 10

Specifying air purity in accordance with ISO8573-1:2010

When specifying the purity of air required, the standard must always be referenced, followed by the purity class selected for each contaminant (a different purity class can be selected for each contamination if required).

An example of how to write an air quality specification is shown below:

ISO 8573-1:2010 Class 1.2.1

ISO 8573-1:2010 refers to the standard document and its revision, the three digits refer to the purity classifications selected for solid particulate, water and total oil. Selecting an air purity class of 1.2.1 would specify the following air quality when operating at the standard's reference conditions :

Class 1 - Particulate

In each cubic metre of compressed air, the particulate count should not exceed 20,000 particles in the 0.1 - 0.5 micron size range, 400 particles in the 0.5 - 1 micron size range and 10 particles in the 1 - 5 micron size range.

Class 2 - Water

A pressure dewpoint (PDP) of -40°C or better is required and no liquid water is allowed.

Class 1 - Oil

In each cubic metre of compressed air, not more than 0.01mg of oil is allowed. This is a total level for liquid oil, oil aerosol and oil vapour.

ISO8573-1:2010 Class zero

- Class 0 does not mean zero contamination.
- Class 0 requires the user and the equipment manufacturer to agree contamination levels as part of a written specification.
- The agreed contamination levels for a Class 0 specification should be within the measurement capabilities of the test equipment and test methods shown in ISO8573 Pt 2 to Pt 9.
- The agreed Class 0 specification must be written on all documentation to be in accordance with the standard.
- Stating Class 0 without the agreed specification is meaningless and not in accordance with the standard.
- A number of compressor manufacturers claim that the delivered air from their oil-free compressors is in compliance with Class 0.
- If the compressor was tested in clean room conditions, the contamination detected at the outlet will be minimal. Should the same compressor now be installed in typical urban environment, the level of contamination will be dependent upon what is drawn into the compressor intake, rendering the Class 0 claim invalid.
- A compressor delivering air to Class 0 will still require purification equipment in both the compressor room and at the point of use for the Class 0 purity to be maintained at the application.
- Air for critical applications such as breathing, medical, food, etc typically only requires air quality to Class 2.2.1 or Class 2.1.1.
- Purification of air to meet a Class 0 specification is only cost effective if carried out at the point of use.
